1 Fieldbus introduction

This section provides information about the CANopen organization and network.

1.1 Introduction to CANopen

CANopen has an international user organisation called CAN in Automation (CiA). For further information regarding CANopen matters not associated with AnyBus-S, please contact CiA on e-mail: headquarters@can-cia.de.

General CANopen information is available on Internet: www.can-cia.de

CANopen is used for industrial automation, normally for the control of valves, sensors and I/O units.

1.2 Network overview

The media for the fieldbus is a shielded copper cable consisting of one twisted pair and two optional cables for the external power supply. As standard, the CANopen AnyBus-S module does not use external power supply. The power for the bus is galvanically isolated with a DC/DC converter mounted on the card. The baudrate can be changed from 10 kbytes/s up to 1 Mbit/s. This can be done in two different ways, either by the DIP switches mounted on the card or with the ‘FIELDBUS_SPECIFIC_INIT’ command sent at start-up. Both master-slave and slave-slave communication is possible.

The maximum amount of data that can be handled by the AnyBus-S CANopen module is 2 kbyte of input data and 2 kbyte of output data.

1.3 Technical features for CANopen

Table 1: Technical features for CANopen

| Technical features for CANopen |
|---|
| <ul style="list-style-type: none">• CANopen specific cable (twisted pair)• Access to intelligence present in low-level devices• Master/Slave and Peer-to-Peer capabilities• Selectable baudrates from 10kbit / s - 1Mbit/s• Max distance 5000m• Support for up to 127 nodes• Node removal without severing the network• Use of sealed or open-style connectors• Provisions for the typical request/response oriented network communications• Provisions for the efficient movement of I/O data• Fragmentation for moving larger bodies of information |

1.4 Related documents

Table 2: Documents related to this manual

| Name | Description | Document number |

| AnyBus-S Parallel Design Guide | Main documentation for the parallel interface version of the AnyBus-S | ABS-DGP-1.13 |
| AnyBus-S Serial Design Guide | Main documentation for the serial interface version of the AnyBus-S | ABS-DGS-1.02 |

2 Module overview

This section provides an overview of the AnyBus-S CANopen module.

2.1 Functional overview

The AnyBus-S module for CANopen is a slave node that can be read and written to from a CANopen master/slave. Via the host connector, the AnyBus-S is connected to an application that gets an instant connection to a CANopen network.

2.2 Mechanical overview

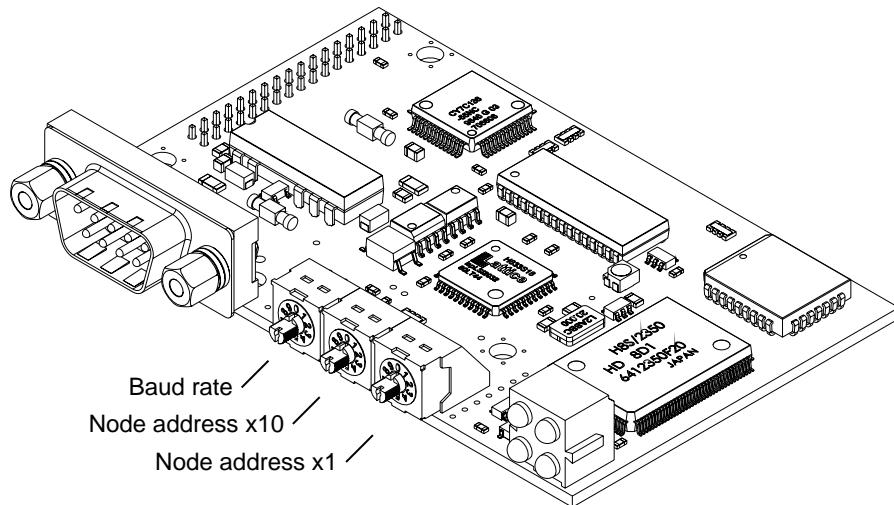

Figure 1: Mechanical overview

2.3 Application interface

This section describes the two access methods available from the application side between the AnyBus-S CANopen module and the application.

- Parallel: Through a Dual Port RAM memory (DPRAM).
- Serial: Through an asynchronous interface

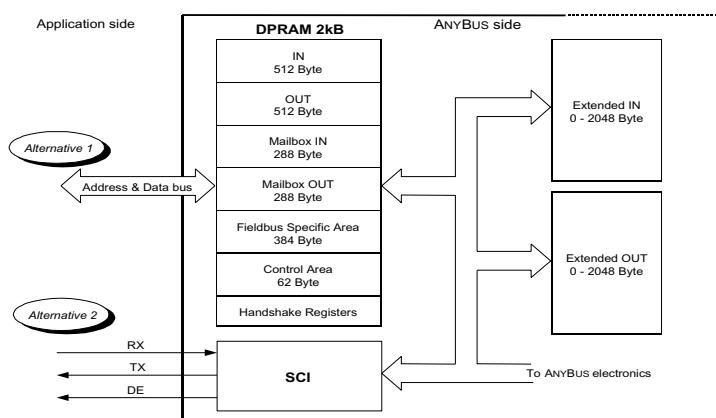

Figure 2: AnyBus-S access methods

2.3.1 Dual-Port RAM

The easiest way to use the AnyBus-S module is to integrate it into the system microprocessor bus. This is achieved using the parallel DPRAM interface. All relevant access and handshaking procedures are achieved through this interface. The handshake procedure is used to ensure that there will always be consistent data available on the host application side as well as on the fieldbus side. In the handshaking procedure, it will generally be the host side that initiates the start of the handshaking and the AnyBus-S module will respond to it.

For more information about designing with the Parallel interface, please consult the AnyBus-S Design Guide for parallel interface.

2.3.2 Asynchronous interface

The asynchronous serial interface allows the AnyBus-S module to exchange data asynchronously with external microprocessors. Some applications cannot access the Dual Port RAM via address and data bus, but have a free serial link. It is therefore possible to operate through the serial interface. The initialisation procedure will be held in a similar way to the Dual Port RAM solution, except the addresses are different and the telegrams are now sent on a serial link.

For more information about designing with the serial interface, please consult the AnyBus-S Design Guide for serial interface.

2.3.3 AnyBus Memory Map

When using Alternative 1 access method (DPRAM), the memory area is a linear data area of 2kByte. When using version 2 (Serial Interface), the information is located in the same structure but with other addresses and it must be accessed via serial telegrams. The AnyBus-S CANopen Memory Map consists of Process Data Objects (fast data) and Service Data Objects (slow data). The data on the CANopen bus is updated when a change is made or on request from another node.

Note: since different hardware is required for the different interfaces, only one of the above mentioned access methods is possible to use in one module.

3 Installation and configuration

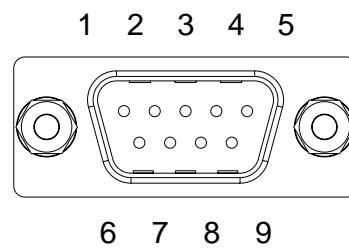

3.1 Fieldbus connector

Note: The standard CANOpen hardware cannot use an external power supply for the bus interface electronics, it will always take the bus power from pin 1 and 2 in the application connector. Contact HMS If you need a module that use an external bus power supply instead of the internal one.

3.1.1 D-SUB connector

Table 3: 9-pin D-SUB fieldbus connector

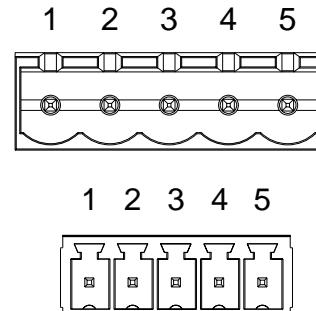

| Connector pin | Signal | Description |
|---------------|----------|-------------------------------------|
| 1 | - | Reserved |
| 2 | CAN_L | CAN_L Bus line (dominant low) |
| 3 | CAN_V- | External bus power minus (optional) |
| 4 | - | Reserved |
| 5 | CAN_SHLD | CAN cable shield |
| 6 | CAN_V- | External bus power minus (optional) |
| 7 | CAN_H | CAN_H Bus line (dominant high) |
| 8 | - | Reserved |
| 9 | CAN_V+ | External bus power plus (optional) |
| Case | CAN_SHLD | CAN cable shield |

3.1.2 Screw terminals

Table 4: 5-pin pluggable/non-pluggable screw terminal fieldbus connector

| Connector pin | Signal | Description |
|---------------|----------|-------------------------------------|
| 1 | CAN_V- | External bus power minus (optional) |
| 2 | CAN_L | CAN_L bus line (dominant low) |
| 3 | CAN_SHLD | CAN cable shield |
| 4 | CAN_H | CAN_H bus line (dominant high) |
| 5 | CAN_V+ | External bus power plus (optional) |

3.1.3 2 mm connector

Table 5: 10-pin 2 mm fieldbus connector

| Connector pin | Signal | Description |
|---------------|----------|-------------------------------------|
| 1 | CAN_SHLD | Optional CAN shield |
| 2 | - | Reserved |
| 3 | CAN_L | CAN_L bus line (dominant low) |
| 4 | CAN_V- | External bus power minus (optional) |
| 5 | CAN_H | CAN_H bus line (dominant high) |
| 6 | CAN_V- | External bus power minus (optional) |
| 7 | - | Reserved |
| 8 | CAN_V+ | External bus power plus (optional) |
| 9 | - | Reserved |
| 10 | CAN_SHLD | CAN cable shield |

Pin 1 is the pin closest to the corner of the card. It has a square-shaped soldering pad on the circuit board, where pins 2-10 have circular soldering pads. See Figure 10 for more information.

3.2 Configuration

3.2.1 Node address

The network node address is set with two rotary switches on the option board (ADDRESS_HIGH and ADDRESS_LOW), see Figure 1, or with the ‘FIELDBUS_SPECIFIC_INIT’ telegram during startup of the module. Possible node address if you use the dip switches are between 1 - 99 in decimal format.

The node address is calculated in the following way:

$$\text{Node address} = (\text{ADDRESS_HIGH} * 10) + (\text{ADDRESS_LOW} * 1)$$

Note: Pdo 3 - 8 only have default cobid's if the node address is less than 64.

Note: The node address cannot be changed during operation.

3.2.2 Baudrate

The baudrate is configured with one decimal rotary switch, or with the ‘FIELDBUS_SPECIFIC_INIT’ telegram during start-up. See table below for supported baudrates. The baudrate switch is located on the ABS module according to Figure 1.

Table 6: Baudrate switch settings

| Switch setting | Baudrate |
|----------------|---------------|
| 0 | Not available |
| 1 | 10 kbit/s |
| 2 | 20 kbit/s |
| 3 | 50 kbit/s |
| 4 | 125 kbit/s |
| 5 | 250 kbit/s |
| 6 | 500 kbit/s |
| 7 | 800 kbit/s |
| 8 | 1 Mbit/s |
| 9 | Not available |

Note: The baudrate can not be changed during operation

3.2.3 Termination

CANopen uses standard CAN termination on the first and last node on the network. The termination resistor should be 120 ohm. This should be connected between CAN_H and CAN_L on the bus. Note that the termination is only used when the AnyBus-S module is the first or last node on the bus.

3.3 LED indicators

The module is equipped with four bi-color status and indication LED's mounted at the front of the module. During start-up a LED test will be performed to make sure the LED's are working. Test sequence is: Red - Green - Off.

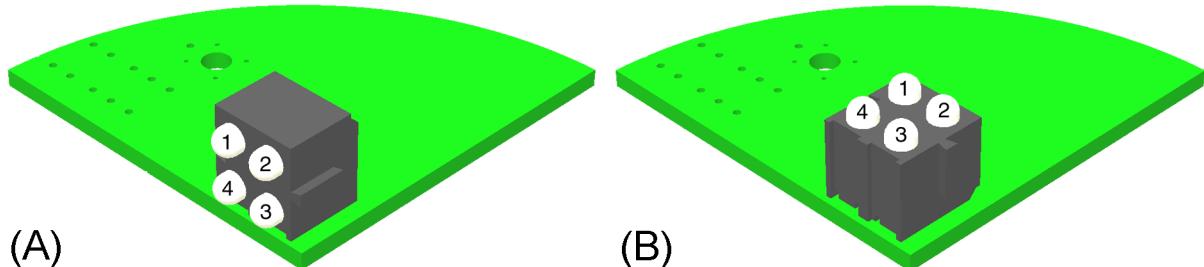

Figure 3: AnyBus-S LED's, with 90° angle mounting (A), and 180° straight mounting (B).

There is also one additional bi-color Watchdog LED on the AnyBus-S module. The function of the watchdog LED is the same for all modules, and information about it can be found in the AnyBus-S Design Guide.

LED 1 is not used on the CANopen module.

Table 7: LED 2 - State indication

| Color | Frequency | Description |
|-------|-----------|-----------------------------------|
| Green | 1 Hz | Module in 'Pre-Operational' state |
| Green | 2 Hz | Module in 'Prepared' state |
| Green | Steady on | Module in 'Operational' state |
| Red | 1 Hz | Bus initialisation failed |

Table 8: LED 3 - Bus indication

| Color | Frequency | Description |
|-------|-----------|-------------------------------------|
| Green | 1 Hz | Bus off / error passive |
| Green | Steady on | Bus running |
| Red | 1 Hz | Other error |
| Off | - | Power off or module not initialised |

Table 9: LED 4 - Power

| Color | Frequency | Description |
|-------|-----------|------------------|
| Green | Steady on | Module has power |

3.4 EDS file

This file is used for configuring up the network. If standard configuration is used this file is not required. If a standard CANopen configurator is used an EDS file is required. The latest version of the EDS file can be downloaded from the HMS Industrial Networks web page, www.anybus.com.

4 Functions and operations

4.1 CANopen Functional Description

The memory structure of the CANopen module is shown in chapter 4.2. There are three areas supported by the AnyBus-S CANopen:

1. High speed data area: this area is transferred on change of value
2. Slow speed data area: this area is transferred on request from another bus node.
3. Mailbox area. In this area a standard mailbox interface is used that includes command, fragmentation of data etc.

4.2 Memory structure for the AnyBus-S CANopen module

Table 10: Memory structure for the AnyBus-S CANopen module

| Address for Parallel interface | Address for Serial interface | Contents | Access |
|--------------------------------|------------------------------|--|---------------------|
| 000h-00Fh | 0000h-0007h | Default Input Fast data area (Area 1) | R/W |
| 010h-1FFh | 0008h-03FFh | Default Input Slow data area (Area 2) | R/W |
| 200h-20Fh | 1000h-1007h | Default Output Fast data area (Area 1) | R/O |
| 210h-3FFh | 1008h-13FFh | Default Output Slow data area (Area 2) | R/O |
| 400h-51Fh | 2000h-208Fh | Mailbox commands (Area 3) | R/W |
| 520h-63Fh | 2090h-211Fh | Mailbox responses (Area 3) | R/O |
| 640h-7BFh | 2120h-21DFh | Fieldbus specific area | Depends on register |
| 7C0h-7FDh | 21E0h-21FEh | Control area | Depends on register |

4.2.1 IN/OUT area - High Speed Data Area

Writing to any byte of the input area of the module with the proper accessing method, will result in an immediate write to the bus. When new data appear on the bus this is immediately copied to the output area.

4.2.2 IN/OUT area - Slow Speed Data Area

Writing to any byte of the input area of the module with the proper accessing method, will result in a buffering of the data until a request is made on the bus to read the data. A write from the bus will result in a transfer to the output area.

4.2.3 Mailbox area

This area uses a standard communication protocol. The description of this protocol can be found in the AnyBus-S design guide. The mailbox commands described in this section is CANopen specific and only includes the commands available under Message type FIELDBUS SPECIFIC MESSAGES. The function of these messages is to enable the user to access CANopen specific functionality. Below the functionality of these commands are described in detail as well as error codes not included in the design guide.

The following fieldbus specific commands are available for the CANopen ABS module.

Table 11: Fieldbus specific commands

| Command ID | Description of command | Section |
|------------|------------------------------|---------|
| 0x01 | Fieldbus Specific init | 5.1.1 |
| 0x10 | CANopen Object Read | 5.1.2 |
| 0x20 | CANopen Object Write | 5.1.3 |
| 0x30 | Emergency message indication | 5.1.4 |
| 0x40 | Fieldbus Remap Command | 5.1.5 |

4.2.4 Fieldbus specific area

This area contains data that is necessary to use for fieldbus specific features.

When reading an 8-bit register with the serial interface, the 8-bit register is loaded into the low 8 bits of the 16-bit word, and the high 8 bits is filled with zeroes.

Table 12: Registers in the fieldbus specific area

| Address (parallel) | Address (serial) | Size (bytes) | Name | Description |
|--------------------|------------------|--------------|------------------------|---|
| 640h | 2120h | 1 | Node address | Contains the nodes current address |
| 641h | 2121h | 1 | Baudrate | Contains the baudrate currently used |
| 643h | 2123h | 1 | Bus state indicator | see object index 2200h in section 6.2.1 - 6.2.3 |
| 644h | 2124h | 1 | Module state indicator | see object index 2205h in section 6.2.1 - 6.2.3 |

| Node address | R/O |
|--------------|-----|
|--------------|-----|

Table 13: Node address register

| Address (parallel) | Address (serial) | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Description |
|--------------------|------------------|----|----|----|----|----|----|----|----|--------------|
| 640h | 2120h | | | | | | | | | Node address |

Note: The bits in this register have the same configuration as the rotary configuration switches on the module.

| Baudrate | R/W |
|----------|-----|
|----------|-----|

Table 14: Baudrate register

| Address (parallel) | Address (serial) | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Description |
|--------------------|------------------|----|----|----|----|----|----|----|----|-------------|
| 641h | 2121h | | | | | | | | | Baudrate |

Note: The bits in this register have the same configuration as the rotary configuration switches on the module.

Bus state indicator

R/O

Table 15: Bus state indicator register

| Address (parallel) | Address (serial) | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Description |
|-----------------------|---------------------|----|----|----|----|----|----|----|----|---------------------|
| 643h | 2123h | | | | | | | | | Bus state indicator |

Note: Also see object index 2200h in section 6.2.1 - 6.2.3

Module state indicator

R/O

Table 16: Module state indicator register

| Address (parallel) | Address (serial) | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Description |
|-----------------------|---------------------|----|----|----|----|----|----|----|----|------------------------|
| 644h | 2124h | | | | | | | | | Module state indicator |

Note: Also see object index 2205h in section 6.2.1 - 6.2.3

4.2.5 Control area

These registers contain information about the status and control environment, both for the fieldbus and the module itself, e.g. fieldbus type, fieldbus state, firmware version, configuration, etc. The following registers are specific for the CANopen module. For further information, please see AnyBus-S Design Guide.

Table 17: Registers in the control area

| Address (parallel) | Address (serial) | Size (bytes) | Name | Description |
|-----------------------|---------------------|-----------------|-------------------------|--|
| 7CCh | 21E6h | 2 | Fieldbus type | Code describing the fieldbus type |
| 7CEh | 21E7h | 2 | Module software version | Version number of the modules software |

Fieldbus Type

R/O

Table 18: Fieldbus Type register

| Address (parallel) | Address (serial) | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | Description |
|-----------------------|---------------------|----|----|----|----|----|----|----|----|---------------------------|
| 7CCh | 21E6h | | | | | | | | | Fieldbus type - high byte |
| 7CDh | - | | | | | | | | | Fieldbus type - low byte |

For a CANopen module, this value should be 0x0020.

Note: Since the serial interface is word-oriented, both high-byte and low-byte are read when reading address 21E6h.

| Module Software version | R/O |
|--------------------------------|------------|
|--------------------------------|------------|

Table 19: Module Software Version register

| Address (parallel) | Address (serial) | b7 b6 b5 b4 b3 b2 b1 b0 | Description |
|-----------------------|---------------------|--|-------------------------------------|
| 7CEh | 21E7h |  | Module software version - high byte |
| 7CDh | - | | Module software version - low byte |

Note: Since the serial interface is word-oriented, both bytes are read when reading address 21E6h.

4.3 Initialization

- Install the module in the application.
- Configure Baudrate with baudrate switch
- Configure Node Address with address switches
- Connect the CANopen network cable
- Connect a CANopen master to the system
- Initialise the module according to standard AnyBus-S initialisation.

5 Mailbox interface

5.1 Fieldbus specific mailbox messages

5.1.1 Fieldbus Specific Init

This telegram is used to make a fieldbus specific initialisation of the AnyBus-S module. The command includes fieldbus specific parameters, as well as standard ANYBUS parameters. When you are going to send a command, the following command response is expected. There are two options available for this command: The first option is to write the ANYBUS set-up variables such as IN/OUT lengths in the fieldbus telegram and not send any ANYBUS init command. The second option is to send a separate ANYBUS init command and then send the fieldbus specific variables such as Node address and baudrate in the fieldbus init command.

Table 20: Mailbox message “FIELDBUS_SPECIFIC_INIT” summary

| Parameter | Description |
|----------------------|------------------------|
| Command initiator | Application |
| Message Name | FIELDBUS_SPECIFIC_INIT |
| Message type | 0x02 |
| Command number | 0x0001h |
| Fragmented | No |
| Extended header data | |
| Message data | |
| Response message | |

Option 1 for parallel interface - init without AnyBus init command sent for parallel interface (ANYBUS variables sent in this telegram).

Command and response layout:

Table 21: Mailbox message “FIELDBUS_SPECIFIC_INIT” memory layout for parallel interface

| Register Name | Command | Expected response | |
|-----------------------------|------------------------|----------------------------------|----------------------------------|
| <i>Message ID</i> | Increased every mess. | Increased every mess. | <i>Fieldbus Specific command</i> |
| <i>Message information</i> | 0x4002 | 0x0002 | <i>Fieldbus Specific init</i> |
| <i>Command</i> | 0x0001 | 0x0001 | |

| <i>Message data word 11</i> | Baudrate | Baudrate | " |

The first 9 message data words are specified in the AnyBus Design Guide for parallel interface. The last 2 message data words are specified in Table 24.

The Fieldbus Specific Fault Handling is specified in extended word 7, the Standard AnyBus fault handling is specified in extended word 8.

Standard AnyBus Fault handling is specified in the AnyBus-S design guide and the Fieldbus Specific Fault Handling is specified in Table 25.

Option 1 for serial interface - init without AnyBus init command sent for serial interface (ANYBUS variables sent in this telegram).

Command and response layout:

Table 22: Mailbox message “FIELDBUS_SPECIFIC_INIT” memory layout for serial interface

| <i>Extended word 3</i> | - | - | " |
| <i>Extended word 4</i> | - | - | " |
| <i>Extended word 5</i> | - | - | " |
| <i>Extended word 6</i> | - | - | " |
| <i>Extended word 7</i> | 0x0000 | Fieldbus Specific Fault handling | |
| <i>Extended word 8</i> | 0x0000 | Standard ANYBUS Fault handling | |
| <i>Message data word 1</i> | IN cyclic I/O length | IN cyclic I/O length | <i>Message data</i> |
| <i>Message data word 2</i> | IN total length | IN total length | " |
| <i>Message data word 3</i> | OUT cyclic I/O length | OUT cyclic I/O length | " |
| <i>Message data word 4</i> | OUT total length | OUT total length | " |
| <i>Message data word 5</i> | Module Status | Module Status | " |
| <i>Message data word 6</i> | ComMode | ComMode | " |
| <i>Message data word 7</i> | Slow Data Priority | Slow Data Priority | " |
| <i>Message data word 8</i> | Heartbeat Min Time | Heartbeat Min Time | " |
| <i>Message data word 9</i> | Reserved | Reserved | " |
| <i>Message data word 10</i> | Node address | Node address | " |
| <i>Message data word 11</i> | Baudrate | Baudrate | " |

The first 8 message data words are specified in the AnyBus-S Design guide for Serial interface, the 9th message data word is reserved, and the last 2 message data words are specified in Table 24.

The Fieldbus Specific Fault Handling is specified in extended word 7, The Standard AnyBus fault handling is specified in extended word 8.

The standard AnyBus error codes is specified in the AnyBus-S design guide and the fieldbus specific error codes is specified inTable 25.

Option 2 for parallel/serial interface - init with ANYBUS init command sent before for both Serial and Parallel Interface (ANYBUS variables sent in the command before this one):

Table 23: Mailbox message “FIELDBUS_SPECIFIC_INIT” memory layout for parallel/serial interface

| Register Name | Command | Expected response | |
|----------------------|-----------------------|----------------------------------|----------------------------------|
| Message ID | Increased every mess. | Increased every mess. | <i>Fieldbus Specific command</i> |
| Message information | 0x4002 | 0x0002 | <i>Fieldbus Specific init</i> |
| Command | 0x0001 | 0x0001 | |
| Data size | 0x0004 | 0x0004 | |
| Frame count | 0x0001 | 0x0001 | |
| Frame number | 0x0001 | 0x0001 | |
| Offset high | 0x0000 | 0x0000 | |
| Offset low | 0x0000 | 0x0000 | |
| Extended word 1 | - | - | <i>No message header data</i> |
| Extended word 2 | - | - | " |
| Extended word 3 | - | - | " |
| Extended word 4 | - | - | " |
| Extended word 5 | - | - | " |
| Extended word 6 | - | - | " |
| Extended word 7 | - | - | " |
| Extended word 8 | 0x0000 | Fieldbus Specific Fault handling | <i>Message data</i> |
| Message data word 1 | Node address | Node address | " |
| Message data word 11 | Baudrate | Baudrate | " |

The two message data words are specified in Table 24 below.

Fieldbus Specific Fault Handling is specified in extended word 8.

The fieldbus specific error codes is specified in Table 25.

Table 24: Possible values for Node address and Baudrate in mailbox message “FIELDBUS_SPECIFIC_INIT”

| Variable | Description | Default value | Possible values |
|--------------|----------------------------------|-------------------|-----------------|
| Node address | Node address of the CANopen node | Set on DIP switch | 1 - 127 |
| Baudrate | Baudrate | Set on DIP switch | 1 - 8 |

Table 25: Possible error codes for mailbox message “FIELDBUS_SPECIFIC_INIT”

| Variable | Description | Possible values |
|--------------|--------------------|-----------------|
| Node address | Node address error | Bit 1 set |
| Baudrate | Baudrate error | Bit 2 set |

5.1.2 Object Read

This section describes the ‘OBJECT_READ’ mailbox telegram. This telegram is used to read a specific entry from the CANopen specific objects. When you are going to send a command, the following command response is expected.

Table 26: Mailbox message “OBJECT_READ” summary

| Parameter | Description |
|----------------------|-------------|
| Command initiator | Application |
| Message Name | OBJECT_READ |
| Message type | 0x02 |
| Command number | 0x0010 |
| Fragmented | No |
| Extended header data | |
| Message data | |
| Response message | |

The possible objects to access are listed in standard CANopen communication profile (DS301) and in object description, section 6.1.3, 6.1.4 and 6.2.

Command and response layout:

Table 27: Mailbox message “OBJECT_READ” memory layout

| Register Name | Command | Expected response | |
|---------------------|-----------------------|---|--|
| Message ID | Increased every mess. | Increased every mess. | |
| Message information | 0x4002 | 0x0002 | |
| Command | 0x0010 | 0x0010 | |
| Data size | 0x0000 | 0x0000 | |
| Frame count | 0x0001 | 0x0001 | |
| Frame number | 0x0001 | 0x0001 | |
| Offset high | 0x0000 | 0x0000 | |
| Offset low | 0x0000 | 0x0000 | |
| Extended word 1 | Index | Index | |
| Extended word 2 | Subindex | Subindex | |

| Extended word 4 | - | - | |
| Extended word 5 | - | - | |
| Extended word 6 | - | - | |
| Extended word 7 | - | - | |
| Extended word 8 | - | Fault handling | |
| Message data word | - | The data bytes of the object read are returned here | |

*Fieldbus Specific command
Object Read*

*One frame
This is frame 1*

The error codes possible are specified in Table 28 below. The information about errors are returned in extended word 8.

Table 28: Possible error codes for mailbox message “OBJECT_READ”

| Description | Possible values |
|---|-----------------|
| Object does not exist | Bit 1 set |
| Subindex does not exist | Bit 2 set |
| No read permission | Bit 3 set |
| The number of bytes returned is to high | Bit 4 set |
| Other fieldbus Specific error | Bit 16 set |

5.1.3 Object Write

This section describes the ‘OBJECT_WRITE’ mailbox telegram. This telegram is used for writing to a specific entry. When you are going to send a command, the following command response is expected.

Table 29: Mailbox message “OBJECT_WRITE” summary

| Parameter | Description |
|----------------------|--------------|
| Command initiator | Application |
| Message Name | OBJECT_WRITE |
| Message type | 0x02 |
| Command number | 0x0020 |
| Fragmented | No |
| Extended header data | |
| Message data | |
| Response message | |

Command and response layout:

Table 30: Mailbox message “OBJECT_WRITE” memory layout

| Register Name | Command | Expected response | |
|---------------------|---|--|--|
| Message ID | Increased every mess. | Increased every mess. | |
| Message information | 0x4002 | 0x0002 | |
| Command | 0x0020 | 0x0020 | |
| Data size | Number of data bytes to write | Number of data bytes that has been written | |
| Frame count | 0x0001 | 0x0001 | |
| Frame number | 0x0001 | 0x0001 | |
| Offset high | 0x0000 | 0x0000 | |
| Offset low | 0x0000 | 0x0000 | |
| Extended word 1 | Index | Index | |
| Extended word 2 | Subindex | Subindex | |
| Extended word 3 | Number of data bytes to write | Number of data bytes that has been written | |
| Extended word 4 | - | - | |
| Extended word 5 | - | - | |
| Extended word 6 | - | - | |
| Extended word 7 | - | - | |
| Extended word 8 | - | - | |
| Message data word | The data bytes of the message is entered here | Fault handling | |
| | | The data bytes of the message is returned here | |

The possible objects to access are listed in standard CANopen communication profile (DS301) and in object description, section 6.1.3, 6.1.4 and 6.2.

The error codes possible are specified in Table 31 below. The information about errors are returned in extended word 8.

Table 31: Possible error codes for mailbox message “OBJECT_WRITE”

| Description | Possible values |
|-------------------------------|-----------------|
| Object does not exist | Bit 1 set |
| Subindex does not exist | Bit 2 set |
| No Write permission | Bit 3 set |
| Wrong byte count error | Bit 4 set |
| Value to High | Bit 5 set |
| Value to Low | Bit 6 set |
| Mapping error | Bit 7 set |
| No Read Permission | Bit 8 set |
| Other fieldbus Specific error | Bit 16 set |

5.1.4 Emergency Message Indication

This section describes the ‘EMERGENCY MESSAGE TELEGRAM’ mailbox telegram. This telegram is used for sending a CANopen specific emergency telegram onto the bus.

Table 32: Mailbox message “EMERGENCY_MESSAGE” summary

| Parameter | Description |
|----------------------|-------------------|
| Command initiator | Application |
| Message Name | EMERGENCY_MESSAGE |
| Message type | 0x02 |
| Command number | 0x0030 |
| Fragmented | No |
| Extended header data | |
| Message data | |
| Response message | |

Command and response layout:

Table 33: Mailbox message “EMERGENCY_MESSAGE” memory layout

| Register Name | Command | Expected response | |

| Fault handling | | | |

5.1.5 Object Mapping

This section describes the ‘OBJECT_REMAPPING’ mailbox telegram. This telegram is used to get an easy way of mapping the Process Data Objects onto the DPRAM area or the SCI internal buffer area. Send down if the mapping is a receive or a transmit object and the number of the object. The data should contain the address in the DPRAM or the address in the SCI internal buffer area where you want to map the object.

Table 34: Mailbox message “OBJECT_REMAPPING” summary

| Parameter | Description |
|----------------------|------------------|
| Command initiator | Application |
| Message Name | OBJECT_REMAPPING |
| Message type | 0x02 |
| Command number | 0x0040 |
| Fragmented | No |
| Extended header data | |
| Message data | |
| Response message | |

Command and response layout:

Table 35: Mailbox message “OBJECT_REMAPPING” memory layout

| Register Name | Command | Expected response | |
|---------------------|--|--|----------------------------------|
| Message ID | Increased every mess. | Increased every mess. | Fieldbus Specific command |
| Message information | 0x4002 | 0x0002 | |
| Command | 0x0040 | 0x0040 | Fieldbus Specific init |
| Data size | Number of data bytes to be included in the message | Number of data bytes to be included in the message | |
| Frame count | 0x0001 | 0x0001 | One frame |
| Frame number | 0x0001 | 0x0001 | This is frame 1 |
| Offset high | 0x0000 | 0x0000 | |
| Offset low | 0x0000 | 0x0000 | |
| Extended word 1 | Transmit = 0x0100 Receive = 0x0200 | Transmit = 0x0100 Receive = 0x0200 | |
| Extended word 2 | Number of the object | Number of the object | |
| Extended word 3 | - | - | |
| Extended word 4 | - | - | |
| Extended word 5 | - | - | |
| Extended word 6 | - | - | |
| Extended word 7 | - | - | |
| Extended word 8 | - | - | |
| Message data word 1 | The DPRAM address or SCI address of the first byte in the object | The DPRAM address or SCI address of the first byte in the object | The address is defined from zero |
| Message data word 2 | The DPRAM address or SCI address of the second byte in the object | The DPRAM address or SCI address of the second byte in the object | The address is defined from zero |
| Message data word 3 | The DPRAM address or SCI address of the third byte in the object | The DPRAM address or SCI address of the third byte in the object | The address is defined from zero |
| Message data word 4 | The DPRAM address or SCI address of the fourth byte in the object | The DPRAM address or SCI address of the fourth byte in the object | The address is defined from zero |
| Message data word 5 | The DPRAM address or SCI address of the fifth byte in the object | The DPRAM address or SCI address of the fifth byte in the object | The address is defined from zero |
| Message data word 6 | The DPRAM address or SCI address of the sixth byte in the object | The DPRAM address or SCI address of the sixth byte in the object | The address is defined from zero |
| Message data word 7 | The DPRAM address or SCI address of the seventh byte in the object | The DPRAM address or SCI address of the seventh byte in the object | The address is defined from zero |
| Message data word 8 | The DPRAM address or SCI address of the eighth byte in the object | The DPRAM address or SCI address of the eighth byte in the object | The address is defined from zero |

The error codes possible are specified in Table 36 below. The information about errors are returned in extended word 8.

Table 36: Possible error codes for mailbox message “OBJECT_REMAPPING”

| Description | Possible values |
|-------------------------------|-----------------|
| PDO number error | Bit 1 set |
| Direction error | Bit 2 set |
| Data error | Bit 3 set |
| Other fieldbus Specific error | Bit 4 set |

6 Fieldbus specific lists and tables

6.1 Object Description for the CANopen Module

6.1.1 Default Fast Input Data to the CANopen Bus

Table 37: Default Fast Input Data to the CANopen Bus

| Input data (High Speed) | PDO mapping | Default COB-ID | Object index | Object subindex | Default State |
|-------------------------|-------------|---------------------|--------------|-----------------|---------------|
| Input data byte 1 - 8 | TPDO1 | 384+ node address | 2000h | 1 - 8 | Enabled |
| Input data byte 9 - 16 | TPDO2 | 640 + node address | 2000h | 9 - 16 | Enabled |
| Input data byte 17 - 24 | TPDO3 | 448 + node address | 2000h | 17 - 24 | Disabled |
| Input data byte 25 - 32 | TPDO4 | 704 + node address | 2000h | 25 - 32 | Disabled |
| Input data byte 33 - 40 | TPDO5 | 960 + node address | 2000h | 33 - 40 | Disabled |
| Input data byte 41 - 48 | TPDO6 | 1088 + node address | 2000h | 41 - 48 | Disabled |
| Input data byte 49 - 56 | TPDO7 | 1216 + node address | 2000h | 49 - 56 | Disabled |
| Input data byte 57 - 64 | TPDO8 | 1344 + node address | 2000h | 57 - 64 | Disabled |

6.1.2 Default Fast Output Data from the CANopen Bus

Table 38: Default Fast Output Data from the CANopen Bus

| Input data (High Speed) | PDO mapping | Default COB-ID | Object index | Object subindex | Default State |
|--------------------------|-------------|---------------------|--------------|-----------------|---------------|
| Output data byte 1 - 8 | RPDO1 | 512 + node address | 2100h | 1 - 8 | Enabled |
| Output data byte 9 - 16 | RPDO2 | 768 + node address | 2100h | 9 - 16 | Enabled |
| Output data byte 17 - 24 | RPDO3 | 576 + node address | 2100h | 17 - 24 | Disabled |
| Output data byte 25 - 32 | RPDO4 | 832 + node address | 2100h | 25 - 32 | Disabled |
| Output data byte 33 - 40 | RPDO5 | 896 + node address | 2100h | 33 - 40 | Disabled |
| Output data byte 41 - 48 | RPDO6 | 1024 + node address | 2100h | 41 - 48 | Disabled |
| Output data byte 49 - 56 | RPDO7 | 1152 + node address | 2100h | 49 - 56 | Disabled |
| Output data byte 57 - 64 | RPDO8 | 1280 + node address | 2100h | 57 - 64 | Disabled |

Note: The default COB-ID for PDO3 - PDO8 is valid only if the node address is lower than 64. If the node address is greater than 63 the COB-ID has to be configured at start-up.

6.1.3 Total Input Data to the CANopen Bus

Table 39: Total Input Data to the CANopen Bus

| Input data (High Speed) | Object Index | Object Subindex |
|-----------------------------|--------------|-----------------|
| Input data byte 1 - 128 | 2000h | 1 - 128 |
| Input data byte 129 - 256 | 2001h | 1 - 128 |
| Input data byte 257 - 384 | 2002h | 1 - 128 |
| Input data byte 385 - 512 | 2003h | 1 - 128 |
| Input data byte 513 - 640 | 2004h | 1 - 128 |
| Input data byte 641 - 768 | 2005h | 1 - 128 |
| Input data byte 769 - 896 | 2006h | 1 - 128 |
| Input data byte 897 - 1024 | 2007h | 1 - 128 |
| Input data byte 1025 - 1152 | 2008h | 1 - 128 |
| Input data byte 1153 - 1280 | 2009h | 1 - 128 |
| Input data byte 1281 - 1408 | 200Ah | 1 - 128 |
| Input data byte 1409 - 1536 | 200Bh | 1 - 128 |
| Input data byte 1537 - 1664 | 200Ch | 1 - 128 |
| Input data byte 1665 - 1792 | 200Dh | 1 - 128 |
| Input data byte 1793 - 1920 | 200Eh | 1 - 128 |
| Input data byte 1921 - 2048 | 200Fh | 1 - 128 |

6.1.4 Total Output Data from the CANopen Bus

Table 40: Total Output Data from the CANopen Bus

| Output data (High Speed) | Object Index | Object Subindex |
|------------------------------|--------------|-----------------|
| Output data byte 1 - 128 | 2100h | 1 - 128 |
| Output data byte 129 - 256 | 2101h | 1 - 128 |
| Output data byte 257 - 384 | 2102h | 1 - 128 |
| Output data byte 385 - 512 | 2103h | 1 - 128 |
| Output data byte 513 - 640 | 2104h | 1 - 128 |
| Output data byte 641 - 768 | 2105h | 1 - 128 |
| Output data byte 769 - 896 | 2106h | 1 - 128 |
| Output data byte 897 - 1024 | 2107h | 1 - 128 |
| Output data byte 1025 - 1152 | 2108h | 1 - 128 |
| Output data byte 1153 - 1280 | 2109h | 1 - 128 |
| Output data byte 1281 - 1408 | 210Ah | 1 - 128 |
| Output data byte 1409 - 1536 | 210Bh | 1 - 128 |
| Output data byte 1537 - 1664 | 210Ch | 1 - 128 |
| Output data byte 1665 - 1792 | 210Dh | 1 - 128 |
| Output data byte 1793 - 1920 | 210Eh | 1 - 128 |
| Output data byte 1921 - 2048 | 210Fh | 1 - 128 |

6.2 Other Parameters

6.2.1 Parameters Combined Parallel and Serial Interface

Table 41: Parameters Combined Parallel and Serial Interface

| Other parameters | PDO mapping | Object Index, Subindex | Indication | Type |
|------------------------|-------------|------------------------|--|------------|
| Bus state indicator | OK | 2200h , 00 | 1 = Bus running 2 = Bus error | UNSIGNED8 |
| Module state indicator | OK | 2205h , 00 | 1 = Init error 2 = Prepared 3 = Pre operational 4 = Operational | UNSIGNED8 |
| Module serial number | RTR only | 2210h , 00 | Unique module serial number | UNSIGNED32 |
| Vendor ID | RTR only | 2211h , 00 | Manufacturer ID | UNSIGNED16 |
| Module status | RTR only | 2212h , 00 | Indicates status set by the application during init | UNSIGNED16 |
| IN cyclic I/O length | RTR only | 2240h , 00 | Fast in length | UNSIGNED16 |
| IN Total length | RTR only | 2242h , 00 | Total in length | UNSIGNED16 |
| OUT cyclic I/O length | RTR only | 2243h , 00 | Fast out length | UNSIGNED16 |
| OUT Total length | RTR only | 2245h , 00 | Total out length | UNSIGNED16 |
| LED status | OK | 2260h - 2263h, 00 | Status of the LED's on the card | UNSIGNED8 |
| Bus-off timeout | RTR only | 2800h , 00 | Indicates the number of ms needed before the node reinitiates and enters pre-operational | UNSIGNED16 |

6.2.2 Parameters Parallel Interface

Table 42: Parameters Parallel Interface

| Other parameters | PDO mapping | Object Index, Subindex | Indication | Type |
|------------------------|-------------|------------------------|---|------------|
| Interrupt count | OK | 2220h , 00 | Interrupt from the application to the AnyBus-S module | UNSIGNED16 |
| Interrupt cause | OK | 2221h , 00 | Indicates the current interrupt source | UNSIGNED16 |
| Interrupt notification | OK | 2222h , 00 | Indicates what source can generate an interrupt | UNSIGNED16 |
| Watchdog counter IN | OK | 2230h , 00 | Watchdog in from the application | UNSIGNED16 |
| Watchdog counter OUT | OK | 2231h , 00 | Watchdog out to the application | UNSIGNED16 |
| IN DPRAM length | RTR only | 2241h , 00 | Total in length in DPRAM | UNSIGNED16 |
| OUT DPRAM length | RTR only | 2244h , 00 | Total out length in DPRAM | UNSIGNED16 |

6.2.3 Parameters Serial Interface

Table 43: Parameters Serial Interface

| Other parameters | PDO map-ping | Object Index, Subindex | Indication | Type |
|--------------------|--------------|------------------------|---|------------|
| Com Mode | RTR only | 2220h , 00 | Indicates What Communication Mode The Module Is In | UNSIGNED16 |
| Slow Data Priority | RTR only | 2221h , 00 | Number of times the fast data is transferred before one slow data package is sent | UNSIGNED16 |
| Heartbeat Min Time | RTR only | 2222h , 00 | The minimum time between two heartbeat messages in ms. | UNSIGNED16 |
| Bootloader Version | RTR only | 2230h , 00 | Watchdog in from the application | UNSIGNED16 |

7 Electrical specifications

7.1 Current consumption

Both the module electronics and the fieldbus interface should be supplied with regulated 5V DC. For more information regarding the power supply, consult the AnyBus-S Design Guide.

Table 44: AnyBus-S CANopen current consumption

| Symbol | Description | Min. | Typ. | Max. | Unit |
|--------|------------------------------------|------|------|------|------|
| IINMOD | Supply current, module electronics | - | TBD | TBD | mA |
| IINBUS | Supply current, bus interface | - | TBD | TBD | mA |

8 Mechanical specifications

8.1 Overview

This section contains mechanical drawings for the AnyBus-S module for CANopen. The fieldbus interface can be either side or top mounted (reverse mounting is not allowed on the 9 pin D-SUB connector). Several other connectors, including plugable screw terminal, are also available for the CANopen AnyBus-S module. For more information regarding other connectors please contact HMS Fieldbus Systems marketing department.

The mechanical drawings describe the standard configuration of the AnyBus-S CANopen module.

Article number for parallel interface: AB4003

Article number for serial interface: AB4025

For further information regarding the AnyBus-S module, we refer to the AnyBus-S Design Guide.

8.2 Mechanical drawings in this manual

These drawings are contained in this section:

- AnyBus-S CANopen module, angled configuration, 3D view
- AnyBus-S CANopen module, angled configuration, top view
- AnyBus-S CANopen module, angled configuration, front and side view
- AnyBus-S CANopen module, straight configuration, 3D view
- AnyBus-S CANopen module, straight configuration, top view
- AnyBus-S CANopen module, straight configuration, front and side view
- AnyBus-S CANopen module, PCB connection points
